Thanks for showing interest in our paper. I am sorry to see that we could be misinterpreted in our understanding of the paper by Steck et al. I propose to clarify this by replacing

"Please note that we do not apply a sequential approach based on retrievals of individual profiles like described by \citet{steck05}, but solve the full 2-D problem." by

"Please note that we do not apply the approach of \citet{steck05}, where the full 2D-state is updated sequentially using in each step only information contained in single profiles or limb-scans, but perform a full update using all available measurement information in each step."
