P15, Line 292-296 Figure 4 The authors mentioned that the measured mass hygroscopic growth factors agree well with the E-AIM model for (NH₄)₂SO₄ and NaCl at temperature of 25 and 5 degree centigrade. According to Figure 4, the data of NaCl measured agree well with model. But in Figure 4 (a) and (b), it seems that the (NH₄)₂SO₄ data from this work are obviously higher than that from the model, conflicting with the author’s description.
